Summary of Production Impacts18	3
Appendix19	)

The purpose of this study is to assess the potential economic impacts in Alaska from oil development in the coastal plain of the Arctic National Wildlife Refuge. Key findings of this study are summarized below.

- Based on \$22 per barrel oil (West Coast), annual Alaska revenues from ANWR oil production could peak at over \$800 million. This includes royalties (assuming a 50/50 state/federal royalty split), severance taxes, property taxes and corporate income taxes. This is based on the "mean" resource volume estimate of 10 billion barrels of technically recoverable oil in ANWR.
- Five years after the first barrel of ANWR oil is pumped, annual state revenues would total approximately \$300 million and after ten years, \$600 million. Peak revenues are reached after approximately 17 years. In addition, lease bonus revenues would add an estimated \$1.5 billion to state coffers.
- With higher oil prices, total annual state revenues could peak at about \$1.3 billion (\$24 per barrel oil). The price of ANS West Coast oil currently stands at about \$27 per barrel.

West Coast Price (\$/bl	ol) \$20.00	\$22.00	\$24.00
Royalties (50/50 state/federal split)	\$130	\$200	\$320
Royalties (90/10 state/federal split)	230	360	570
Severance Taxes	270	420	660
Corporate Income Taxes	60	100	160
Property Taxes	80	100	140
Total Alaska Revenues (50/50 royalty split)	\$540	\$830	\$1,280
Total Alaska Revenues (90/10 royalty split)	\$650	\$990	\$1,530

#### State of Alaska Revenues from ANWR Oil Production Peak Annual Values (millions of dollars)

Subtotals may not add to totals due to rounding.

- Based on \$22 per barrel oil, development of ANWR's oil resources could create approximately 25,000 jobs in Alaska and \$1.7 billion in labor income (assuming a 50/50 royalty split).
- Five years after the first barrel of ANWR oil is pumped, Alaska employment gains would total approximately 10,000 jobs and after ten years, 19,000 jobs. Peak employment would be reached after approximately 17 years.
- With higher oil prices, total Alaska employment could peak at just over 38,000 jobs and \$2.6 billion in labor income (\$24 per barrel oil).

West Coast Price (\$/bbl)	\$20.00	\$22.00	\$24.00
Peak Employment			
Oil Industry	9,000	14,000	21,000
State and Local Governments	7,000	11,000	17,000
Peak ANWR-Related Employment	17,000	25,000	38,000
Peak Labor Income (millions)			
Oil Industry	\$800	\$1,200	\$1,900
State and Local Governments	300	500	800
Peak ANWR-Related Income	\$1,200	\$1,700	\$2,600

#### Employment and Labor Income Impacts of Oil Development in ANWR Peak Annual Employment and Labor Income

Subtotals may not add to totals due to rounding.

- To place these employment figures in perspective, Alaska's economy now includes approximately 280,000 wage and salary jobs, accounting for \$9.7 billion in total annual payroll.
- This analysis focuses primarily on economic impacts after production begins. However, in a five-year construction and development phase, employment and labor income could peak at 11,000 jobs and just over \$500 million.
- Additional jobs and income will be created in the Alaska economy through ANWR-related contributions to the Permanent Fund. Contributions to the Permanent Fund from ANWR revenues could total just under \$3 billion over the first 15 years of ANWR production, based on \$22/barrel oil.
- ANWR-related Permanent Fund dividends paid to Alaskans would reach an accumulated total in excess of \$300 million after 15 years of ANWR production. In-state spending of those dividends would create approximately 700 jobs annually (jobs not included in the table above).

The purpose of this study is to estimate potential economic impact in Alaska from oil production from the coastal plain of the Arctic National Wildlife Refuge (ANWR). Several studies have been conducted on the potential volume of technically recoverable oil contained in Area 1002 and adjacent areas. The United States Geological Survey (USGS) conducted the most comprehensive assessment of the economically recoverable oil contained in Area 1002.<sup>1</sup> However, this is the first effort to predict the economic benefits that could accrue to Alaska as a result of oil development in ANWR.

It is important that readers of this report understand the uncertainty inherent in this type of analysis. Following are several of the critical sources of uncertainty:

- *The volume of ANWR oil that is technically recoverable.* As described later in this report, geologists estimate that ANWR contains between 6 billion and 15 billion barrels of technically recoverable oil. The potential economic benefits from ANWR development could be similarly divergent. Added to this uncertainty is the potential for technological advances, which most certainly will occur over the multi-decade potential productive life of the ANWR fields. Such advances would increase the volume of technically recoverable oil. They can also increase the volume of oil that is economically recoverable. The nature and timing of such advances, however, is impossible to predict.
- *Future oil prices*. The price of oil is the key factor in determining how much oil could be economically produced from ANWR. With oil prices subject to occasionally wild swings, the volume of ANWR oil in the ground that is "economic" may in six months be double what it is today, or conversely, half of what it is today.
- *Cost factors.* The cost of production, including royalty rates and taxes, is at this time uncertain with regard to ANWR. Royalty rates could be between 12.5 percent and 16.7 percent, the difference of course representing millions of dollars to state and federal government, and potentially thousands of jobs in Alaska. The effect of other cost and revenue factors are similarly difficult to foresee, such as the Economic Limit Factor (ELF, applied to severance tax calculations) which depends on the number of producing wells and the volume of oil produced during any given period.

In addition to the questions surrounding the volume and value of the ANWR oil resource, there is significant uncertainty about how production would translate into economic benefits for Alaska. Economists use models to predict the number of jobs and income that would be created by increased spending in an economy, whether from new oil development, a new fish processing plant, or increased tourism. However, even the most sophisticated model represents a gross simplification of the highly complex, real-world economy.

<sup>&</sup>lt;sup>1</sup> Economics of Undiscovered Oil in the 1002 Area of the Arctic National Wildlife Refuge, Chapter EA (Economic Analysis), Emil D. Attanasi, 1999, U.S. Geological Survey, Open File Report 98-34.

While recognizing this uncertainty, every effort has been made to incorporate reasonable, and generally conservative, assumptions into this analysis. The assessment is intended to add more information to the ANWR debate. As better data becomes available in the future, the assumptions made here can be refined, and a clearer picture of the potential economic benefits of ANWR presented.

This economic analysis focuses primarily on the Alaska employment and labor income effects of ANWR development. The analysis included use of IMPLAN Pro version 2.0, a software package that provides a predictive model of local and state economies.

The results of this analysis are time-dependent only to the extent that economic linkages between sectors of the Alaska economy change over time. In other words, employment and labor income estimates are based on present-day multipliers. Ten years from now, for example, Alaska's economy will likely have changed, and economic relationships, represented by multipliers, may be different. Otherwise, oil prices and cost factors have been held constant.

#### **ANWR Oil Resources**

In May 1998, the United States Geological Survey (USGS) released a report regarding the oil and gas potential for the 1002 area of the Arctic National Wildlife Refuge (ANWR). This report provided an update of a USGS assessment conducted ten years earlier. The new report, entitled "The Oil and Gas Resource Potential of the Arctic National Wildlife Refuge 1002 Area, Alaska," used data generated from wells drilled, oil discoveries made near ANWR, improved technological processes and interpretative methodologies to generate updated oil and gas resource estimates.

The entire coastal plain area includes 1.5 million acres of Federal 1002 land. Within the area there are approximately 92,000 acres of subsurface estate owned by the Arctic Slope Regional Corporation (ASRC), which are subject to Refuge regulations.<sup>2</sup> There are also more than 10,000 acres of other privately owned Native allotments within ANWR that are not subject to Refuge regulations. The area includes State land between the coast and the three-mile off-shore boundary. It is estimated that 74 percent of technically recoverable oil is located on Federal land, with the remaining 26 percent divided between the private and State lands.<sup>3</sup>

#### **In-Place Oil Resources**

The 1998 USGS report estimated in-place oil resources within the Federal 1002 area at between 11.6 and 31.5 billion barrels (95 and 5 percent probabilities, respectively), with a mean value of 20.7 billion barrels.<sup>4</sup> This estimate differs from the 1987 inplace oil resource assessment of 4.8 and 29.4 billion barrels (95 and 5 percent probabilities), with a mean value of 13.8 billion barrels of oil. In-place oil resources represent the estimated natural endowment or occurrence of oil resources based upon geologic knowledge and theory. It does not take into account the recoverability of the resource.

Statistical Estimate	1987 USGS Federal 1002 Area Assessment (BBO) <sup>1</sup>	1998 USGS Federal 1002 Area Assessment (BBO) <sup>1</sup>	1998 USGS Entire Coastal Plain Area Assessment (BBO)
95% (19 in 20 chance)	4.8	11.6	15.6
Mean Value	13.8	20.7	27.8
5% (1 in 20 chance)	29.4	31.5	42.3

Table 1In-Place ANWR Oil Resources, 1987 and 1998 USGS Assessments

1 – The Oil and Gas Resource Potential of the Arctic National Wildlife Refuge 1002 Area, Alaska (May, 1998).

<sup>&</sup>lt;sup>2</sup> The surface estate is owned by Kaktovik Inupiat Corporation (KIC), an Alaska Native village corporation.

<sup>&</sup>lt;sup>3</sup> Technically recoverable oil is the volume of oil that can be recovered with existing technology, regardless of cost.

<sup>&</sup>lt;sup>4</sup> A 95 percent probability means that there is a 19 in 20 chance of finding this volume of oil. A 5 percent probability means there is a 1 in 20 chance.

#### **Technically Recoverable Resources**

Technically recoverable resources are that volume of the resource that may be recoverable given current technology while disregarding the cost of recovery. This can also be interpreted as estimating the supply of oil given current recovery technology, without regard to the demand, or the amount that could be profitably produced at a given market price. The 1998 USGS report estimated the technically recoverable petroleum resources of the Federal 1002 area between 4.3 and 11.8 billion barrels (95 and 5 percent probabilities), with a mean value of 7.7 billion barrels of oil. The amount of technically recoverable resources within the entire coastal plain area is estimated to be between 5.7 and 16 billion barrels (95 and 5 percent probabilities), with a mean value of 10.3 billion barrels of oil.

# Table 2Technically Recoverable Oil Resources in Federal 1002 Area and the<br/>Entire ANWR Coastal Plain

Statistical Estimate	Federal 1002 Area (BB0) <sup>2</sup>	Entire ANWR Coastal Plain (BBO) <sup>1</sup>
95% (19 in 20 chance)	4.3	5.7
Mean Value	7.7	10.3
5% (1 in 20 chance)	11.8	16.0

#### **Economically Recoverable Resources**

Both in-place and technically recoverable resources are static numbers (not considering technological advances). A third measure of oil resources is highly dynamic. Economically recoverable resources are those resources that would be produced given a certain market price. Economically recoverable resources are therefore a function of price. Given the volatility of oil prices, it is difficult to predict clearly how much oil would be produced at any given time. For the Federal 1002 area of ANWR, given a market price of \$15 a barrel (1996 dollars, West Coast delivery, or about \$16.60 in current dollars), no oil production would occur, according to the USGS assessment. When the market price increases to \$20 (1996 dollars), 3.2 billion barrels or 42 percent of the estimated mean amount of technically recoverable oil is economic to produce. When the market price increases to \$24 a barrel (1996 dollars), the economically recoverable amount of oil increases to 5.2 billion barrels, or 68 percent of the estimated mean value of 7.7 billion barrels of oil.

Incremental Cost or Market Price of a Barrel of Oil	Economically Recoverable Oil (billion barrels)	Percent of Mean Value for Federal 1002 Area of ANWR
15.2	00.0	00.0
15.3	0.8	10.3
16	1.1	14.1
17	1.8	23.9
18	2.4	31.1
19	2.6	34.3
20	3.2	41.6
21	4.0	51.8
22	4.4	56.6
23	5.0	65.4
24	5.2	68.1
25	5.6	73.2
26	5.8	75.5
27	6.1	78.5

# Table 3Economically Recoverable Oil Resources in ANWRAt Various Oil Price LevelsFederal 1002 Area1

1 – E. Attanasi USGS (August, 2002). Prices in 1996 dollars, West Coast delivery.

#### **ANWR Oil Production Rates**

The Energy Information Administration (EIA), within the U.S. Department of Energy, estimates that the period of time required from approval to conduct lease sales to production of oil from ANWR would be between seven and 12 years (the EIA authors assume nine years in their analysis).

Regarding production rates, the EIA formulated production schedules based on technically recoverable resource estimates. Assuming a one-year lag between developments, the EIA estimated 40-year production schedules with new fields coming online each year for 25 years. Given this production schedule for technically recoverable oil resources, oil production would occur over 65 years. For purposes of this analysis, this production schedule is independent of price.

The production schedules postulated by the EIA are based upon increasing field production rates for the first two years, followed by a peak production rate in the third year. Beginning the fourth year, production would decline. The assumptions made in this production schedule differ from the schedule produced by the EIA two years later. In February of 2002 the EIA suggested that there would be a two-year lag between fields coming online. Further, production rates would increase for three to four years before peaking and going into decline.

In this study, the production rates predicted by the EIA in 2002 were used, though the rates were applied to estimates of the economically recoverable oil, not all technically recoverable oil. Production rates are provided in the appendices to this report and are based on three price scenarios; \$20, \$22 and \$24 per barrel, West Coast delivery, in 2001 dollars. These prices are approximately equivalent to \$18, \$20 and \$22 per barrel oil in 1996 dollars, as presented in Table 3. ANS West Coast oil prices as of August 29, 2002, were at \$27.40 per barrel. Since 1990, real (inflation-adjusted) ANS West Coast prices have averaged about \$22 per barrel.

#### Introduction

There would be four major sources of State revenues from oil development in ANWR—State and Federal mineral lease revenues, property taxes, production taxes, and corporate income tax. There have been no significant changes since 1995 in the State or Federal statutes governing these sources. This section of the report describes these revenue sources and the assumptions made to estimate revenues for ANWR.

#### Mineral Lease Revenues

Mineral lease revenues include cash bonuses, lease rentals, and royalties. This economic impact analysis focuses only on royalties. Lease rentals are generally an insignificant source of revenue compared to royalties. Bonuses can be very significant, but unpredictable. The potential lease bonus revenue from ANWR has been estimated at \$1.5 billion.<sup>5</sup>

The State Division of Oil and Gas, Department of Natural Resources has an ongoing leasing program in the State waters off ANWR, out to the 3-mile boundary of State jurisdiction. All State lease sales off ANWR have used a fixed 12.5 percent royalty.

Federal lease sales in ANWR's 1002 Area could include royalties as high as 16.7 percent. Recent lease sales in the National Petroleum Reserve – Alaska (NPRA) have used a 12.5 percent royalty in areas with low petroleum potential, and a 16.7 royalty in high potential areas. The total volume of ANWR's technically recoverable oil is comparable to NPRA. But, it is concentrated in larger accumulations in an area 1/12 the size of NPRA, close to existing feeder pipelines. ANWR recovery is potentially far more economic than even NPRA's high potential acreage.<sup>6</sup>

The USGS economic analysis of ANWR assumed a 16.7 percent royalty (on Federal lands).<sup>7</sup>

Legislative bill H.R. 4, which authorizes ANWR 1002 Area development, passed the U.S. House August 2, 2001. It is now in conference with the Senate-passed version of H.R. 4, which contains no ANWR development authorization. Section 6506(a)(1) of H.R. 4, as passed by the House, provides that ANWR leases shall have a minimum royalty of 12.5 percent.

Under the Alaska Statehood Act, the State is entitled to 90 percent of Federal mineral lease revenues. However, Congressional authorization of oil and gas leasing in ANWR is likely to reduce that to 50 percent. Section 6512 of H.R. 4 provides for a 50-50 State/Federal split of bonuses, lease rentals, and royalties. The 50/50 split is the

<sup>&</sup>lt;sup>5</sup> From the Energy Information Administration web site t http://www.eia.doe.gov/oiaf/aeo/leg\_reg.html

<sup>&</sup>lt;sup>6</sup> U.S. Geological Survey 2002 Petroleum Assessment of the National Petroleum Reserve in Alaska (NPRA), USGS, May 2002.

<sup>&</sup>lt;sup>7</sup> *Economics of Undiscovered Oil in the 1002 Area of the Arctic National Wildlife Refuge*, Chapter EA (Economic Analysis), Emil D. Attanasi, 1999 in U.S. Geological Survey, Open File Report 98-34.

most likely division of revenues if ANWR development is authorized. This economic analysis is based on the 50/50 split, though the impacts of a 90/10 split on state revenues are considered.

#### **Property Tax**

Under AS 43.56, the State levies a 20-mill tax (2 percent) on the assessed value of all oil and gas exploration, production, and transportation tangible property. Municipalities may also levy a tax on the property, up to 20 mills. Taxpayers are allowed a credit against their tax liability to the State for any property taxes paid to municipalities. In FY 2001, the North Slope Borough's property tax levy left about 5 percent of the total authorized tax to the State. In other words, the Borough levied a tax of about 19 mills, leaving one mill for the State after the credit.<sup>8</sup>

Property tax revenues to the state and local governments will depend on the schedule and value of investments made in development and production from ANWR. The USGS has made estimates of rates of development, and has formulated cost factors in its ANWR economic analysis. However, specific development schedules and associated costs are not available. In this analysis, a flat rate of \$0.50 per barrel of oil produced is used to estimate total property tax revenues. This includes tax revenues to the state and local governments. This rate was used in a recent NPRA economic assessment.<sup>9</sup>

Statewide, property taxes on tangible oil and gas property have produced revenues ranging from about \$0.60 to \$0.75 per barrel (2001 dollars) over the past 12 years.<sup>10</sup>

#### **Production (Severance) Taxes**

Under AS 43.55, the State levies a tax on the production of oil, excluding the Federal or State government's royalty share of production. The tax is the higher of a percent of value or a cents per barrel tax, in both cases multiplied by the economic limit factor (ELF). For ANWR, the tax would be 12.25 percent of the gross value of production at the wellhead for the first five years of production and 15 percent thereafter. The cents per barrel tax is 80 cents, adjusted for crude oil API gravity.

The cents per barrel tax can be ignored. USGS' latest analysis<sup>11</sup> indicates no commercial development of ANWR would occur if oil prices were below \$13 in 1996 dollars. In today's dollars the minimum threshold would be even greater. The 80 cents per barrel tax would be effective only with wellhead prices below \$6.53 during the first five years of production or below \$5.33 thereafter.

The ELF formula for oil production is

ELF = (1-(300 X Wells)/Volume)^((150,000/Volume)^1.5333)

<sup>9</sup> NPRA Final Integrated Activity Plan/Environmental Impact Statement, US Department of Interior, Bureau of Land

Management and Minerals Management Service, August 1998. http://aurora.ak.blm.gov.NPRA/final/html.

<sup>&</sup>lt;sup>8</sup> Spring 2002 Revenue Sources Book, Alaska Department of Revenue, Tax Division, page 73,

http://www.tax.state.ak.us/SourcesBook/2002SpringSources/index.htm.

<sup>&</sup>lt;sup>10</sup> Based on data provided in DOR's Spring 2002 Revenue Sources Book and earlier editions of the same publication. <sup>11</sup> Arctic National Wildlife Refuge, 1002 Area, Petroleum Assessment, 1998, Including Economic Analysis, USGS, April 2001.

Where "Wells" is the number of producing wells in the field and "Volume" is the total daily production for the field. The ELF reduces the production tax on wells as their productivity declines. It also reduces the tax on small fields. In this study an ELF is assumed to be 1.0 for the first 17 years of ANWR production (until production peaks), then it is assumed to decline at an annual rate of 2 percent (0.02) annually thereafter.

There is also a State Hazardous Release Surcharge on production taxes. The money is to be used for prevention of, and emergency response to, hazardous substance spills. The tax rate is 3 cents per barrel on all oil production, except Federal and State royalty production. The tax rate is 5 cents per barrel when the balance in the State's Oil and Hazardous Substance Release Prevention and Response Fund falls below \$50 million. During Fiscal Year 2001, the fund balance exceeded \$50 million. Because this is a minor tax, it is not included in this analysis.

#### **Corporate Income Tax**

Under AS 43.20.072, the State levies a corporate income tax on oil and gas production and transportation. It is based on a 2- or 3-factor apportionment of a corporation's worldwide income from oil and gas activities. The factors are Alaska's proportion of worldwide production, property, and sales. Petroleum producers are apportioned based on production and property, including intangible as well as tangible drilling and development costs. Pipeline operators are apportioned based on property and sales, including tariffs. Producers and pipeline operators are apportioned based on all three factors. The tax is a graduated rate on taxable income up to \$90,000. The marginal rate on income above \$90,000 is 9.4 percent.

Since 1985, corporate income taxes paid by the oil industry in Alaska have averaged 25 percent of total royalty payments. This is purely a statistical relationship; however, in the absence of better data it provides a starting point for estimating ANWR-related corporate income tax revenues.

#### Summary

The following table provides estimated Alaska revenues from ANWR, under various price scenarios (West Coast delivery price). These estimates include revenues to local government from property taxes, as well as estimated royalties to private ANWR landowners. Detailed annual estimates are provided in the appendix.

Alaska Revenues from ANWR Oil Production Peak Annual Values (millions of dollars)					
West Coast Price (\$/bbl)	\$20.00	\$22.00	\$24.00		
Royalties (50/50 state/federal split)	\$130	\$200	\$320		
Royalties (90/10 state/federal split)	230	360	570		
Severance Taxes	270	420	660		
Corporate Income Taxes	60	100	160		
Property Taxes	80	100	140		
Total Alaska Revenues (50/50 royalty split)	\$540	\$830	\$1,280		
Total Alaska Revenues (90/10 royalty split)	\$650	\$990	\$1,530		

# Table 4

#### **Economic Impacts During Exploration and Development**

Before oil begins to flow from ANWR, seven to 12 years of exploration and development work would be required. During this period, the economic impact in Alaska of ANWR development would include lease bonuses and employment stemming from exploration and construction activity. These impacts are addressed below.

#### **Pre-Production Revenues to the State**

The Congressional Budget Office estimated that a total \$3.0 billion in bonus bids would be received from ANWR.<sup>12</sup> Assuming a 50/50 state/federal split, Alaska's share would total \$1.5 billion. The timing of when these bonuses would be received is somewhat uncertain, but it is likely to occur within three to four years of the date that ANWR development is authorized.

Half of the state's \$1.5 billion share would be deposited in the Permanent Fund. Also, 0.5 percent would be deposited in the Public School Fund Trust. The balance would go to the state's general fund where it would be spent on a range of public services or capital projects. Because these bonus revenues would be a one-time contribution to the general fund it is not appropriate to attribute a specific number of jobs to the ANWR revenues. However, including direct, indirect and induced effects, this \$740 million in general fund money would translate into an equivalent amount of payroll for Alaskan workers.<sup>13</sup>

Other than the lease bonuses, there are no significant pre-production revenues to state government. There would be rental incomes generated between the time that the bids occur and production (while exploration and development is taking place); however, these per-acre rental incomes would be insignificant from a state budgeting perspective. Property tax revenues would also begin flowing pre-production, mostly to the North Slope Borough.

#### **Oil Industry Pre-Production Employment and Labor Income**

Thousands of jobs will be created during the pre-production phase of ANWR's development. This includes wildcat drilling, development drilling, pipeline construction and construction of field facilities (drill pads, flow lines from drilling sites, the central processing unit, and facilities for housing workers).

Because most of ANWR's oil is apparently contained in a number of moderate-size and smaller fields (rather than one "elephant" field), investment will be incremental, beginning with the largest, lowest-cost fields followed by the smaller, higher-cost

<sup>&</sup>lt;sup>12</sup> "Budget Options", issued February 2001, Congressional Budget Office <u>http://www.cbo.gov/</u>.

<sup>&</sup>lt;sup>13</sup> Based on labor income per dollar of output ratio for state and local government of about 1 to 1, as indicated by the IMPLAN model.

fields, as market conditions allow. In any case, very little data exists on initial investment and manpower requirements for ANWR oil development. The USGS estimates that construction of an 85-mile pipeline from the TAPS to a central location in the Western Area of Area 1002 would cost \$378 million in 1996 dollars.<sup>14</sup> This includes cost of materials, pipe, installation, pump stations and construction of a parallel gravel haul road. Another \$198 million pipeline would be required to link the Eastern Area, but presumably this investment would occur well after the Western Area was at or near full production.

Drilling costs are estimated to average \$8 to \$10 million per wildcat well. Drilling and completion costs per production wells for depths to 5,000 feet are assumed at \$2.2 million, 5,000 to 10,000 feet \$2.73 million, 10,000 to 15,000 feet \$3.31 million, greater than 15,000 feet, \$5.76 million (all in 1996 dollars).<sup>15</sup>

The greatest cost associated with ANWR development would be in facilities investment, which is dependent on the size of fields being developed. Facilities investment costs range from over \$4 per barrel for fields of under 100 million barrels to around \$1 per barrel for large fields (1 billion barrels), according to the USGS. It is not possible to predict with any degree of certainty the intensity of the initial ANWR development effort; however, it is reasonable to assume that facilities to produce one-third of the economic oil reserves – about a billion barrels of oil – would be constructed. Assuming an average cost of \$2 per barrel, initial investment in facilities would cost approximately \$2 billion total. Add to that pipeline construction costs and drilling costs, and the initial investment could total approximately \$3 billion.

This investment, which would occur over several years, would translate into substantial employment and labor income impacts. Based on the assumed investment schedule shown in the following table, this construction and development phase employment would peak at 11,000 jobs with labor income of just over \$500 million.<sup>16</sup>

Fiscal Year	Investment (millions)	Employment	Labor Income (millions)
Years 1 - 4	_	_	_
Year 5	\$300	4,000	\$170
Year 6	400	6,000	260
Year 7	600	8,000	350
Year 8	700	10,000	430
Year 9	900	11,000	520

<sup>&</sup>lt;sup>15</sup> Ibid, page EA-39.

<sup>&</sup>lt;sup>16</sup> IMPLAN multipliers for New Industrial and Commercial Buildings were used to estimate total employment impacts.

#### **Oil Industry Employment and Income Impacts from ANWR Production**

This section provides estimates of oil industry employment and payroll associated with ANWR oil production. These jobs include employment associated with finding, developing, and producing ANWR oil. Indirect and induced jobs are also considered. Indirect jobs are those created in the many businesses that provide goods and services to the oil industry. Induced impacts occur through in-state spending of employee payroll dollars. Multipliers generated by the IMPLAN model are used to estimate these impacts. These multipliers are shown in Table 5.

	Direct	Indirect	Induced	Total
Employment dollars of output (1)	2.66	2.127	3.237	8.024
Labor Income (2)	0.2734	0.1044	0.1066	0.4847

#### Table 6 IMPLAN Multipliers for Oil and Gas Production in Alaska

1 - Based on 1998 dollars, jobs per million dollars of output.

2 - Labor income per dollar of output.

These multipliers suggest that for each million dollars of output (oil produced) a total of eight jobs are created in Alaska. For every million dollars in output, \$480,000 in direct, indirect and induced labor income is created.

Direct employment and labor income multipliers are applied to the value of ANWR oil at the Valdez terminal (well-head plus transportation to the TAPS, plus the TAPS tariff). To avoid potential double counting of jobs created by state spending of ANWR revenue, indirect and induced employment are based on Valdez value less taxes and royalties.

It should be noted that these IMPLAN multipliers are based on 1998 dollars. Therefore, the revenue estimates were adjusted to 1998 dollars before the multipliers were applied.<sup>17</sup>

Annual oil industry employment estimates due to ANWR production are provided in the Appendix to this report. Oil industry-related employment, including direct, indirect and induced employment, steadily increases from initial production to a peak of approximately 14,000 jobs.<sup>18</sup>

#### State Government Revenue-Related Employment and Payroll

The economic impact of state revenues derived from ANWR production would depend on several factors. Most important is how the money is used. ANWR revenue would be split along three paths: to the Alaska Permanent Fund, to the state operating budget, or the state capital projects budget. The next section describes how ANWR revenue to the state is likely to be distributed among these three categories. Then the employment and payroll impacts of state spending of ANWR

<sup>&</sup>lt;sup>17</sup> The Producer Price Index (PPI) for crude petroleum, domestic production, as published by the Bureau of Labor Statistics, was used to convert 2001 oil values to 1998 oil values.

<sup>&</sup>lt;sup>18</sup> Based on an average price of \$22 per barrel oil.

revenue are described (based on the assumptions made about the distribution of ANWR-related revenue into various state coffers).

#### **Distribution of State Revenue from ANWR**

For fields leased prior to 1980, at least one-quarter (25 percent) of all mineral lease rentals, royalties, royalty sale proceeds, federal mineral revenue sharing payments and bonuses received by the State of Alaska must be deposited in the Permanent Fund.<sup>19</sup> For fields leased after 1980, a 50 percent contribution to the Permanent Fund is required. In addition, a contribution of 0.5% of all royalties and bonuses must be deposited in the Public School Fund Trust.

Of the balance, 95 percent of revenues are assumed to be spent through the state operating budget. Over the past five fiscal years, the unrestricted General Fund split between operating and capital budgets has between 95 percent and 97 percent operating and 3 to 5 percent capital.<sup>20</sup>

#### Table 7 Alaska State Operating and Capital Projects Enacted Budgets, FY 1997 to FY 2001 (millions of dollars)

	Fiscal Year	<b>Operating Expenditures</b>	Capital Expenditures	Percent Operating
	1997	\$2,046.2	\$100.0	95%
	1998	\$2,033.6	\$97.7	95%
	1999	\$2,022.8	\$89.9	96%
	2000	\$1,973.9	\$81.5	96%
	2001	\$2,014.0	\$71.8	97%

#### **Employment and Payroll from Operating Budget Expenditures**

IMPLAN splits state and local government into two components: education and non-education. In this analysis it is assumed that 35 percent of the ANWR revenues spent through the operating budget would be spent on education.<sup>21</sup>

Direct, indirect, induced and total multipliers are provided in the following table. The education component of government has relatively high direct multipliers because payroll is (usually by far) a school district's single largest budget item.

IMPLAN reports a zero indirect multiplier for state and local government. While a low indirect multiplier would be expected, a zero multiplier clearly understates actual indirect impacts. Nevertheless, the IMPLAN multipliers taken as a whole appear reasonable and are used in this analysis.

<sup>21</sup> Based on the FY 2001 budget, Summary of Appropriation, Legislative Finance Division,

<sup>&</sup>lt;sup>19</sup> Spring 2002 Revenue Source Book, Alaska Department of Revenue, Tax Division, page 75.

http://www.tax.state.ak.us/SourcesBook/2002SpringSources/index.htm.

<sup>&</sup>lt;sup>20</sup> Based on data provided by the Legislative Finance Division at http://www.legfin.state.ak.us/. This distribution does not include "Statewide" expenditures, such as supplemental appropriations, debt retirement and fund capitalization. In the economic impact analysis Statewide expenditures are treated as operating expenditures.

http://www.legfin.state.ak.us/.

# Table 8IMPLAN Multipliers for State andLocal Government Operations in Alaska

	Direct	Indirect	Induced	Total
Employment (1)				
State and Local Government - Education	22.313	0	6.368	28.681
State and Local Government - Non-Education	14.917	0	5.019	19.936
Weighted Average (35% Education)	17.506	0	5.491	22.997
Labor Income (2)				
State and Local Government - Education	1.000	0	0.1830	1.183
State and Local Government - Non-Education	0.784	0	0.1446	0.929
Weighted Average (35% Education)	0.860	0	0.1580	1.0179

1 - Based on 1998 dollars, jobs per million dollars of output.

2 - Labor income per dollar of output.

These multipliers indicate that state revenue spent on education generates a total of 28.7 jobs per million dollars of output (or expenditure). State spending on other operating budget items creates a total of approximately 20 jobs per million dollars. To estimate total state and local government employment impacts from ANWR revenue to state government, a weighted average of 23 jobs per million dollars was used. Revenue estimates, made in 2001 dollars, were adjusted to 1998 dollars before the multipliers were applied.<sup>22</sup>

Labor income multipliers are also provided in Table 8. These multipliers indicate that for every dollar of ANWR revenue that flows to the state operating budget, a total of \$1.02 of labor income will be created.

#### **Employment and Payroll from Capital Budget Expenditures**

Though a relatively small part of the overall impact, the employment and income effects of capital budget expenditures must be considered separately because of significantly different multiplier effects. Table 9 provides IMPLAN multipliers for two categories of construction, New Highways and Streets, and New Government Facilities. For purposes of this analysis, it was assumed that 80 percent of the capital project budget would be spent on highway construction-related projects. This assumption results in a total multiplier of 13.6 jobs per million dollars. Labor income totals \$600,000 per million dollars of expenditure.

<sup>&</sup>lt;sup>22</sup> Adjustment from 2001 dollars to 1998 dollars was based on the Anchorage Consumer Price Index.

	Direct	Indirect	Induced	Total
Employment (1)				
New Highways and Streets	7.813	2.622	3.376	13.810
New Government Facilities	5.494	3.688	3.599	12.781
Weighted Average (80% Highways)	7.349	2.835	3.4206	13.604
Labor Income (2)				
New Highways and Streets	0.408	0.0875	0.01	0.595
New Government Facilities	0.402	0.124	0.106	0.633
Weighted Average (80% Highways)	0.407	0.0947	0.029	0.603

Table 9IMPLAN Multipliers for Capital Projects in Alaska

1 - Based on 1998 dollars, jobs per million dollars of output.

2 - Labor income per dollar of output.

It is important to recognize that the assessment of capital budget-related employment and labor income effects does not consider the federal match on State of Alaska capital projects. The case could be made that ANWR revenue would leverage additional federal dollars into Alaska and therefore the economic impact of ANWR includes jobs and income created through expenditure of federal matching money. This analysis, however, considers expenditure of the state portion only.

#### Permanent Fund Dividend-Related Employment and Payroll

Fifty percent of royalties and severance taxes generated from ANWR would be deposited in the Permanent Fund. These deposits will create additional dividends for Alaskans and spending of those dividends will create jobs and income in the state's economy. Dividends are assumed to equal half of an assumed real 4 percent annual earnings on the Permanent Fund.

The economic impact of the Permanent Fund Dividend program was addressed in a study by Scott Goldsmith in 1989.<sup>23</sup> That study found that the dividend created approximately 13 jobs per million dollars, in 1988 dollars. Since 1988, Alaska's economy has undergone significance support sector expansion, meaning that relatively more of the dividend may be spent in Alaska today than in 1988. On the other hand, inflation has been at work, and in 2001 dollars, the 13 jobs per million spent translates to about nine jobs per million. It is assumed that these two factors are approximately equal and off-setting, and a 13 jobs per million estimate is used here.

<sup>&</sup>lt;sup>23</sup> *The Economic Impact of the Alaska Permanent Fund Dividend,* prepared by Institute of Social and Economic research, University of Alaska Anchorage, for the Alaska Permanent Fund Corporation.

#### **Summary of Production Impacts**

Table 10 summarizes the employment and labor income impacts in Alaska stemming from oil development in ANWR. The table provides peak employment and income, which occurs about 17 years after the first barrel of oil is pumped. These estimates are based on a 50/50 royalty split.

### Table 10Employment and Labor Income Impacts of Oil Development in ANWRPeak Annual Employment and Labor Income

West Coast Price (\$/bbl)	\$20.00	\$22.00	\$24.00
Peak Employment			
Oil Industry	9,000	14,000	21,000
State and Local Governments	7,000	11,000	17,000
Peak ANWR-Related Employment (1)	17,000	25,000	38,000
Peak Labor Income (millions)			
Oil Industry	\$800	\$1,200	\$1,900
State and Local Governments	300	500	800
Peak ANWR-Related Income (1)	\$1,200	\$1,700	\$2,600

1 - Subtotals may not add to totals due to rounding.

These totals do not include jobs and income generated through ANWR-related Permanent Fund Dividends. The employment and income effects related to the Permanent Fund Dividend increase over time, as annual deposits add to the principal of the fund and dividends increase. After 30 years, ANWR will have generated \$5 billion in contributions to the principal, based on \$22 per barrel oil. Instate spending of dividends paid to Alaskans would create hundreds of jobs in the Alaska economy. After 30 years of ANWR production, spending of ANWR generated dividends would be responsible for over 1,000 jobs a year in the Alaska economy. This employment and payroll is not included in Table 10.

### Appendix

Revenue, Employment and Labor Income Impacts of ANWR Production (\$24/barrel)
