

Can Coal be Clean? Efforts to Reduce Coal's Environmental Footprint

An Anglo American – Anglo Coal Perspective

**Alaska Business Roundtable on Climate Change
14 February 2008**

**Roger Wicks
Head of Energy – Anglo American plc
Head of Strategy – Anglo Coal**

Structure of the Presentation

- ▶ **Energy and climate change – conflicting imperatives**
- ▶ **Climate change scenarios**
- ▶ **Coal fired route to near zero emissions**
- ▶ **Clean Coal Technologies (CCT) - coal upgrading, dealing with particulates, acid rain and other pollutants**
- ▶ **Global greenhouse gas emissions**
- ▶ **Coal fired plant efficiency and CO₂ emissions**
- ▶ **Carbon Capture and Storage (CCS) – its contribution, the technology, costs and recent developments**
- ▶ **Anglo Coal – approaches to and examples of process and product stewardship**

Energy and Climate Change imperatives cannot be seen in isolation

We live in a world where the contrast between energy abundance and energy poverty is stark

By 2030 - Global population approaching 8 billion; if nothing new is done, 1.4 bn without access to electricity and 2.6 billion still reliant on primitive/erratic sources

By 2030 the IEA forecasts Coal (44%) and Gas (23%) will account for two thirds of global power generation

We have to simultaneously address energy demand as a driver of development and climate change imperatives to reduce CO₂ and other GHG's

Earth at Night

Immutable Force meets Global Imperative

World Energy Outlook 2007 – IEA Nov 2007

- ▶ World faces a fossil energy future to 2030
- ▶ Primary energy needs grow by 55% 2005 to 2030 (BAU)
- ▶ Developing countries contribute 74% of the increase in global primary energy use
- ▶ The resurgence of coal driven by power demand in China and India is a marked departure from past WEO's
- ▶ Rising demand poses a real and growing threat to energy security
- ▶ Unchecked fossil fuel use will hasten climate change
- ▶ Urgent action on CCS and related technologies by all

IPCC Fourth Assessment Report – Nov 2007

- ▶ Warming of the climate system is unequivocal
- ▶ CO₂ is most important anthropogenic GHG
- ▶ Very likely increase in frequency of weather extremes
- ▶ Adaptation and mitigation options are available but the pace of adoption and scale of application needs to increase markedly
- ▶ Cooperative efforts, a price for carbon – market pull and a research driven technological push are imperative
- ▶ Macro-economic costs are considered tolerable if we act early

Climate Change Policy Scenarios – where are we now?

Coal Fired Route to Near Zero Emissions

Under the direct control of utilities;
open to influence by producers and technology advance by equipment suppliers

Under the direct control of coal producers

The need for collaboration by coal producers, equipment suppliers and power utilities is paramount

CCT - Coal upgrading

- ▶ **Washing raw coal in a processing plant**
- ▶ **Removes a portion of the non-combustible material**
- ▶ **Reduces the ash content – can be by up to 50%**
- ▶ **Reduces the sulphur dioxide (SO₂) subsequently emitted by the coal**
- ▶ **Improves thermal efficiency – so reducing CO₂ emissions**

CCT – Particulates, Acid Rain and Other

- ▶ **Particulates - finely divided solid and liquid (other than water) substances emitted from a power station**
 - ▶ Electrostatic precipitators
 - ▶ Fabric filters or bag houses
 - ▶ Wet particulate scrubbers
 - ▶ Hot gas filtration systems

- ▶ **SO₂ and NO_x emissions**
 - ▶ Flue gas desulphurisation
 - ▶ Low NO_x burners and burner optimisation
 - ▶ Selective catalytic and non-catalytic reduction

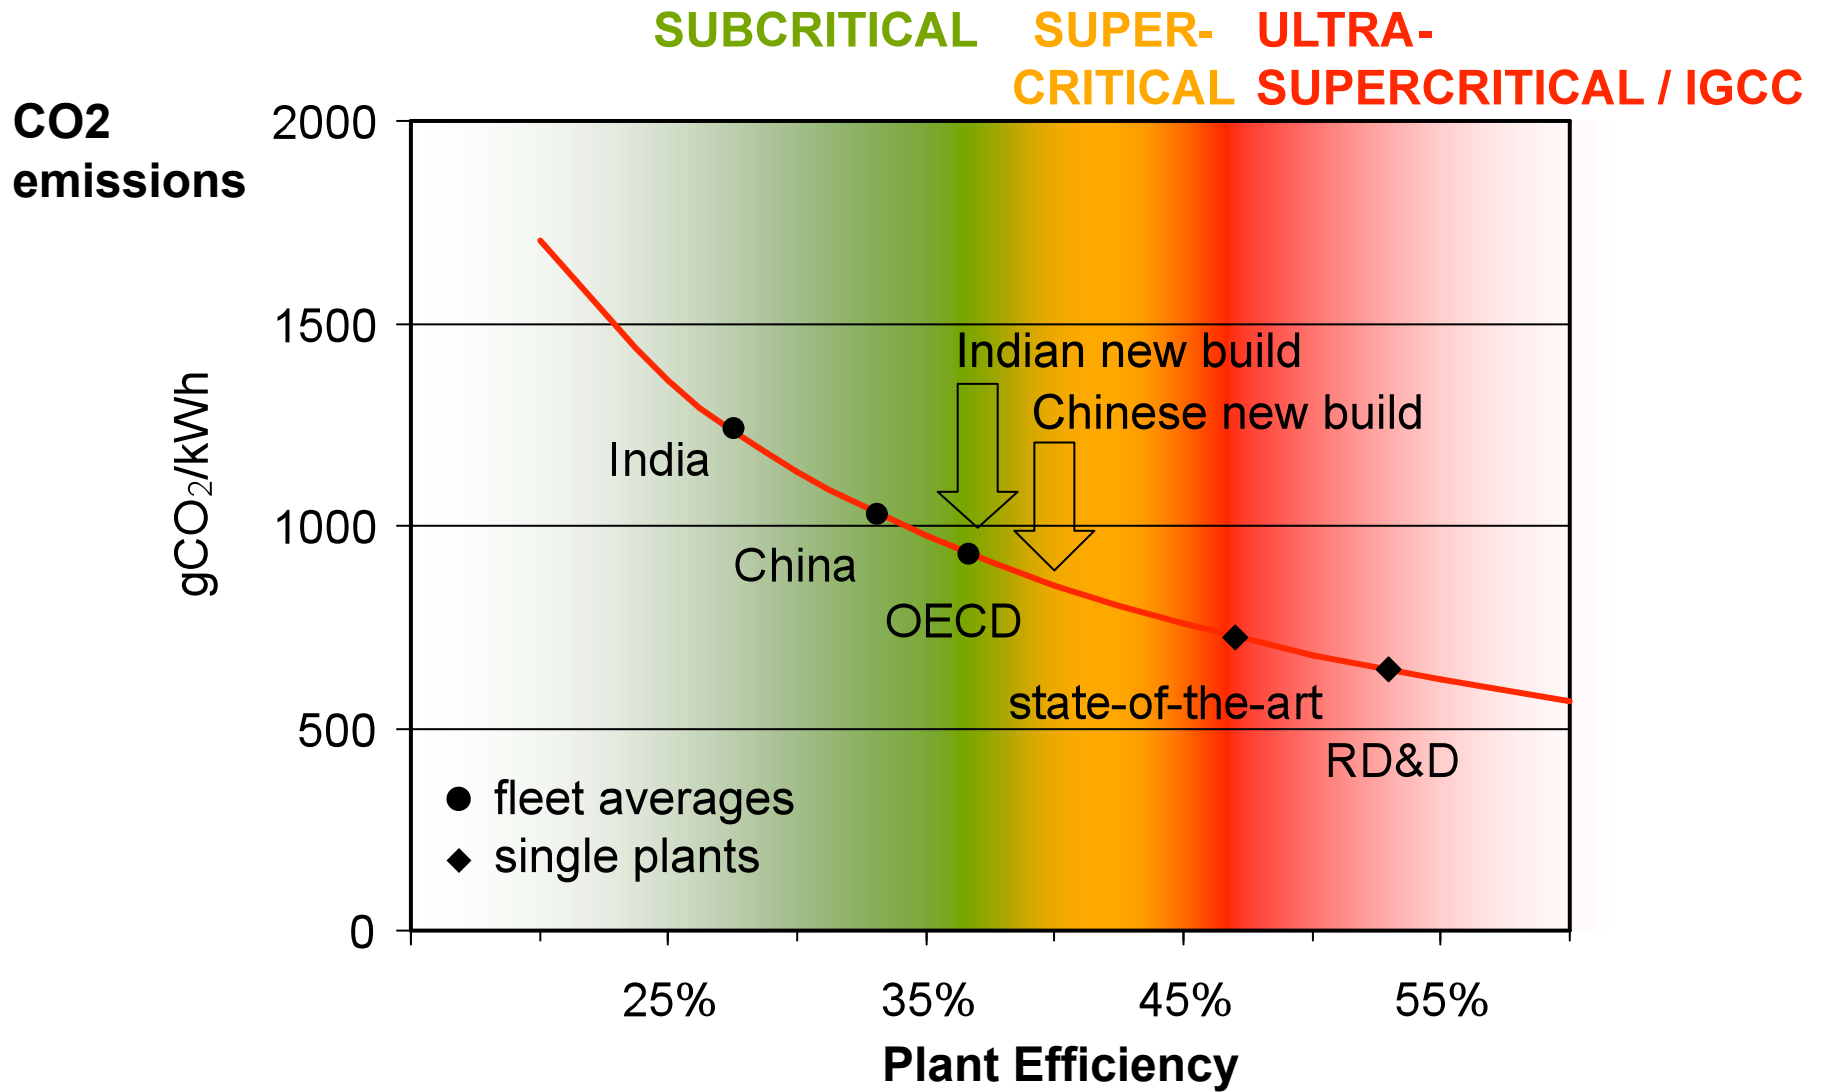

- ▶ **Other – Trace Elements, Mercury and Ash**

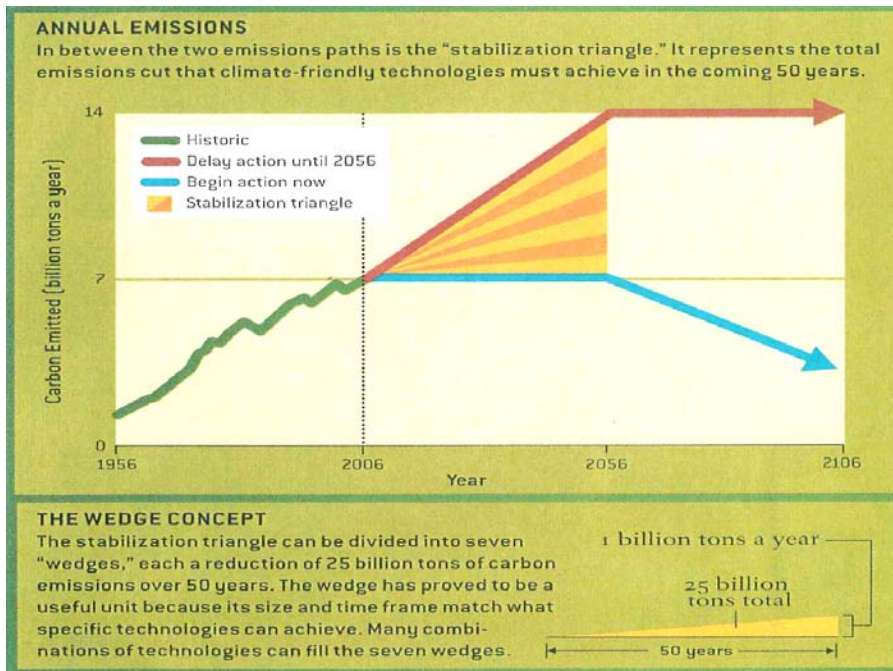

Global Greenhouse Gas Emissions – Activity Sources and Fuels

Coal Fired Plant Efficiency and CO₂ Emissions

Carbon Capture and Storage (CCS) - where does it fit and how does it contribute?

15 WAYS TO MAKE A WEDGE

An overall carbon strategy for the next half a century produces seven wedges' worth of emissions reductions. Here are 15 technologies from which these seven can be chosen (taking care to avoid double-counting). Each of these measures, when phased in over 50 years, prevents the release of 25 billion tons of carbon. Leaving one wedge blank symbolizes that this list is by no means exhaustive.

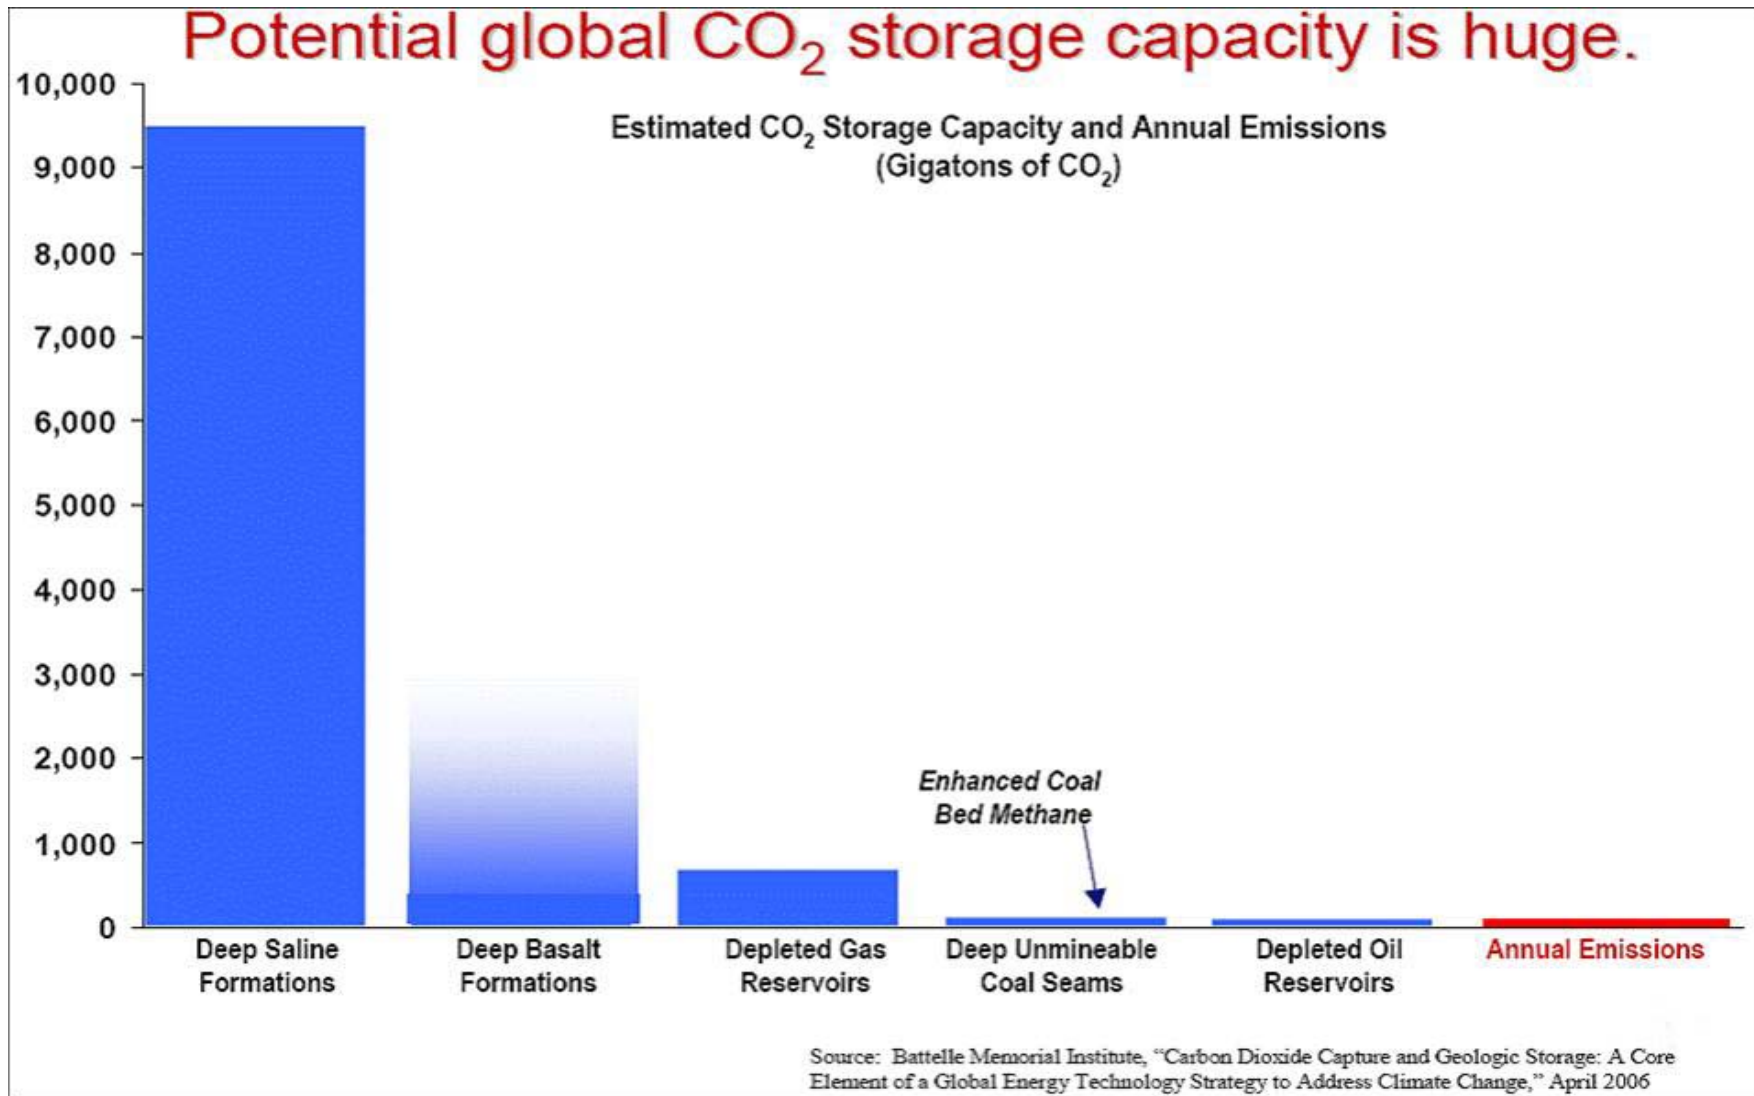

NOTES:
¹Wedge size in 2056 could well be ten billion cars. Assume they average 18,000 miles a year.
²"Large" is one gigawatt (GW) capacity. Plants run 90 percent of the time. Here and below, assume coal plants run 90 percent of the time at 50 percent efficiency. Present coal power output is equivalent to 800 such plants.
³Assume 90 percent of CO₂ is captured.
⁴Assume a car (18,000 miles a year, 60 miles per gallon equivalent) requires 1700 kilograms of hydrogen a year.
⁵Assume 30 million barrels of syngas a day, about a third of today's total oil production. Assume half of carbon originally in the coal is captured.
⁶Assume wind and solar produce, on average, 30 percent of peak power. Thus replace 2,100 GW of 90 percent-time coal power with 2,100 GW (peak) wind or solar plus 1,400 GW of wind-following coal power, for net displacement of 700 GW.
⁷Assume 60 mpg cars, 10,000 miles a year, 50-mass yield of 15 tons a hectare, and negligible fossil-fuel inputs. World cropland is 1,500 million hectares.
⁸Carbon emissions from deforestation are currently about one billion tons a year. Assume that by 2056 the rate falls by half in the business-as-usual projection and to zero in the flat path.
⁹Assume 60 mpg cars, 10,000 miles a year, 50-mass yield of 15 tons a hectare, and negligible fossil-fuel inputs. World cropland is 1,500 million hectares.
¹⁰Carbon emissions from deforestation are currently about one billion tons a year. Assume that by 2056 the rate falls by half in the business-as-usual projection and to zero in the flat path.
¹¹Assume 60 mpg cars, 10,000 miles a year, 50-mass yield of 15 tons a hectare, and negligible fossil-fuel inputs. World cropland is 1,500 million hectares.

CCS is one of a number of key technologies to be developed and deployed at large scale

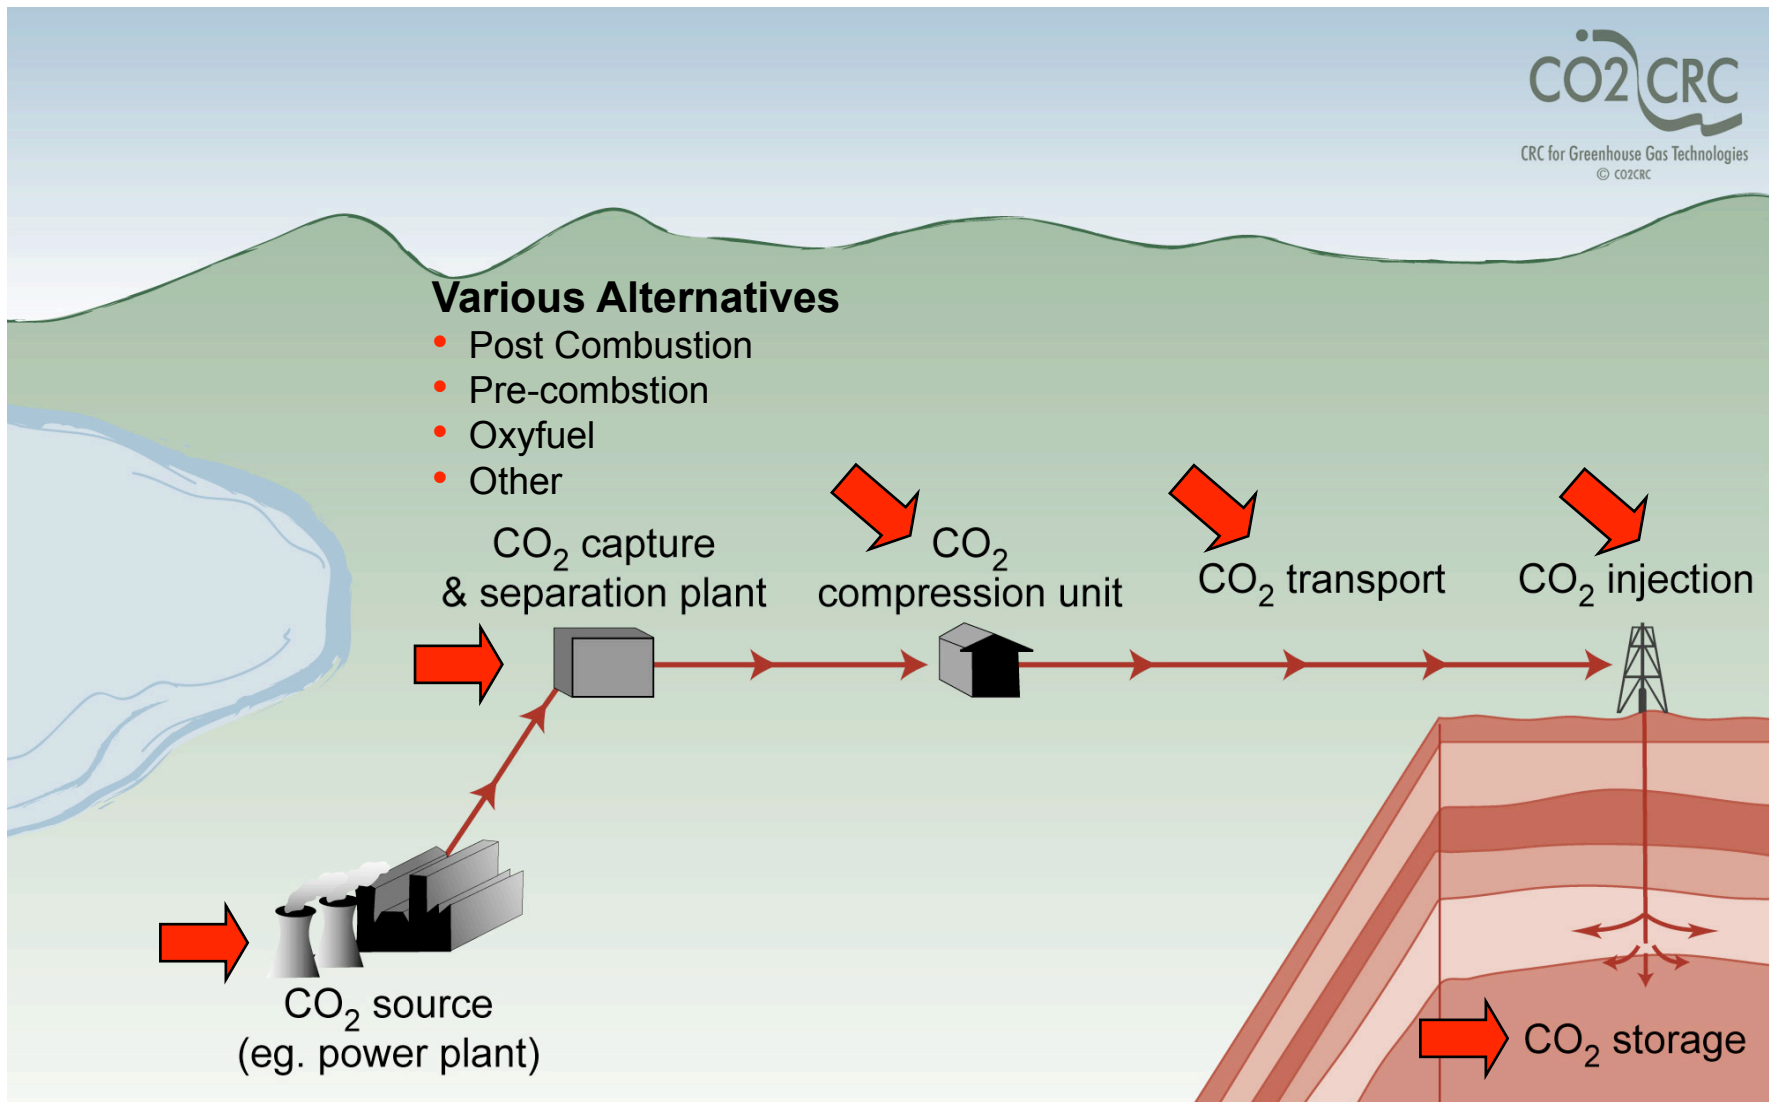

IPCC 2005 Study on CCS : "... could contribute 15 – 55% of the cumulative mitigation effort worldwide until 2100"

Global Storage Capacity

CCS – the basic concept – 1

Key components

CCS – the basic concept 2

Geological Storage Options

Overview of Geological Storage Options

- 1 Depleted oil and gas reservoirs
- 2 Use of CO₂ in enhanced oil and gas recovery
- 3 Deep saline formations — (a) offshore (b) onshore
- 4 Use of CO₂ in enhanced coal bed methane recovery

Why does CO₂ stay underground?

- ▶ When pumped underground it is compressed to a higher pressure and becomes a liquid
- ▶ The liquid is trapped between the spaces (pores) between the grains of rock by several means
 - **Structural storage**
 - ▶ Initially more buoyant than water, it rises up and is trapped by an impermeable layer or cap rock
 - **Residual storage**
 - ▶ Reservoir rocks act like a tight, rigid sponge trapping the CO₂ within the pore spaces
 - **Dissolution storage**
 - ▶ CO₂ dissolves in salty underground water and being heavier than the surrounding water sinks to the bottom of the reservoir
 - **Mineral storage**
 - ▶ CO₂ dissolved in salty underground water is weakly acidic and can react with minerals in the surrounding rocks to form new minerals and create coatings on existing rocks. Sometimes slow and sometime fast, this binds the CO₂ to the surrounding rocks

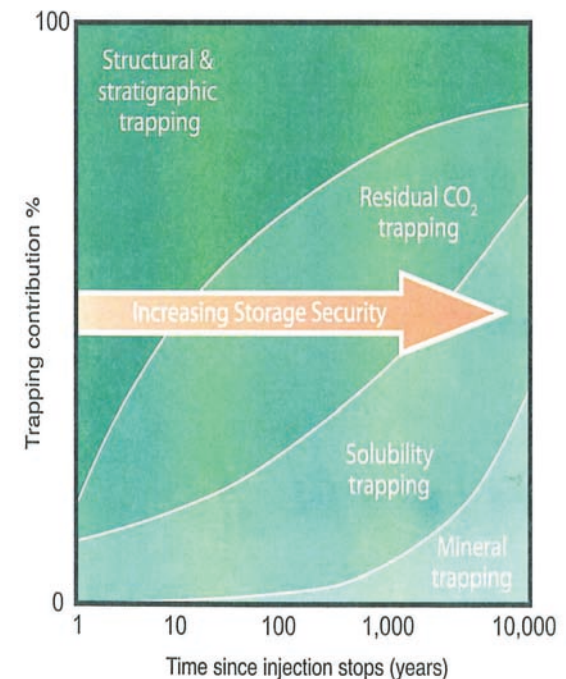

Figure 5.9 Storage security depends on a combination of physical and geochemical trapping. Over time, the physical process of residual CO₂ trapping and geochemical processes of solubility trapping and mineral trapping increase.

- **Additional R&D on microalgae, ocean fertilisation and other methods**

Geological storage of CO₂ – Project locations

CO₂ Storage Demonstration Projects

CCS technology is at varying states of maturity

Maturity of CCS technology

CCS Cost estimates vary

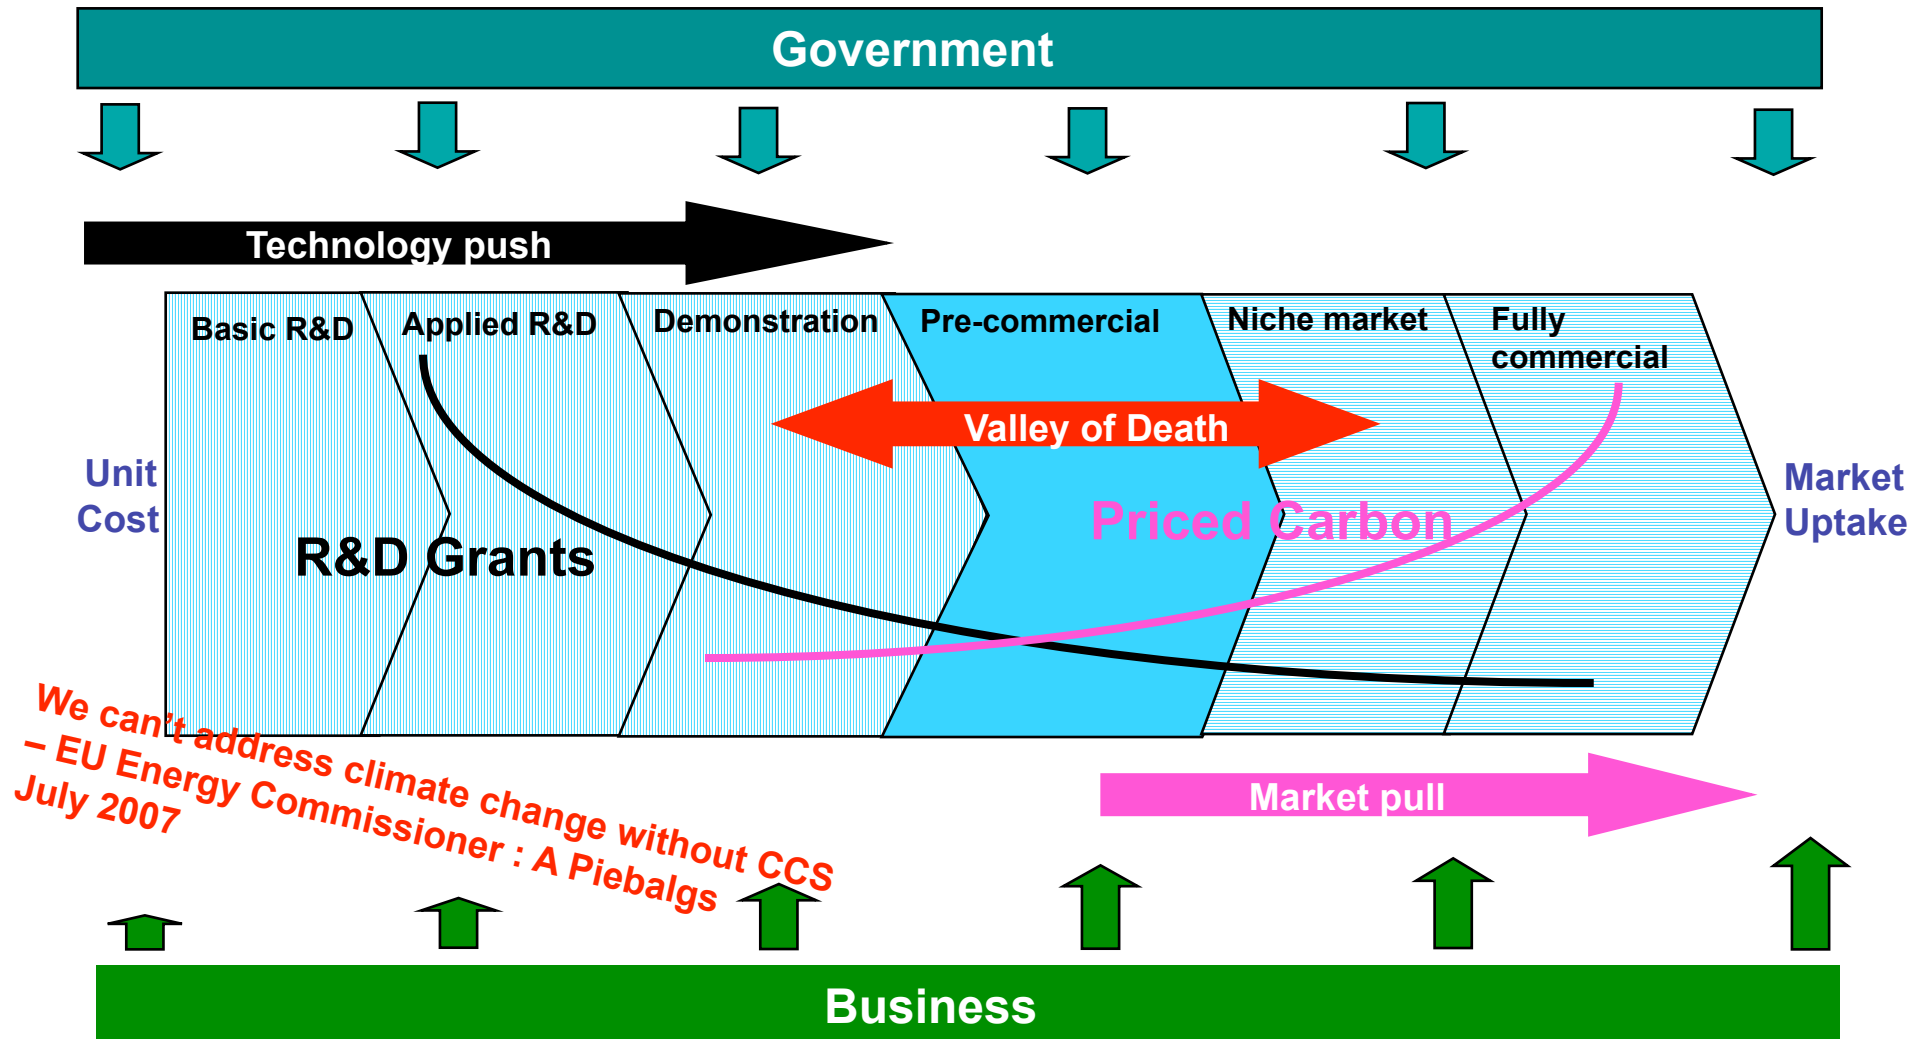

Tech Support, IPCC – IEA GHGP Financing Workshop July 2007

Power plant capture	US\$/tCO ₂ net captured 15 - 75
Capture (gas proc/amm prod)	US\$/tCO ₂ net captured 5 – 55
Capture ex other ind sources	US\$/tCO ₂ net captured 25 – 115
Transportation per 250 km	US\$/tCO ₂ net 1 -8
Geological storage	US\$/tCO ₂ injected 0.5 – 8
Ocean storage	US\$/tCO ₂ injected 5 – 30
Mineral carbonation	US\$/tCO ₂ net mineralized 40 - 100

RWE Scenario Analysis - IEA GHGP Financing Workshop July 2007

	(Euro millions/MW)	
	Hard Coal	Lignite
Investment cost		
Without CCS	1.2	1.35
With CCS	1.68	1.75
Efficiency after 2020 in %		
Without CCS	52	51
With CCS	44	43

The need for faster progress is clear, and there are pitfalls to be avoided ...

Important recent developments

- ▶ **July 2007 - Ospar Commission (Protection of the Marine Environment for the North East Atlantic) decision to permit CO₂ storage under the seabed**
- ▶ **July 2007 - CDM Methodology panel : CCS for CDM projects – decision now late 2008**
- ▶ **EU decision to support CCS – EU Technology Platform on Zero Emission Power Plants (ETP ZEP) – going beyond Norway and the Netherlands**
- ▶ **Gleneagles Plan of Action – G8+5**
 - **GLOBE; IEA GHGP and CSLF working on accelerated development of policy to promote commercial deployment - G8 summit in Japan in 2008**
- **Bali Climate Conference**

Process Stewardship

Energy Intensity and Carbon Emissions Intensity Reduction – RSA Example

Energy Management matrix on each operation:

- Energy Champion
- Baseline establishment and metering
- DSM Projects and DMP with Eskom
- Energy and CO₂ targeting
- Project portfolio

Landau Haul Road Project

- Diesel saving 17% (reduced rolling resistance and gradient)
- Improved safety (less dust and reduced wet weather impact – able to haul after 28mm rain)

Lighting

- 55 000 CFL Eco-lights at Operations
- 37 000 CFL Eco-lights at Mine Village Houses
- R 10 million investment

Capcoal waste mine gas initiative

Award Winning Projects in RSA

Basa Magogo Njengo Project

- 10 000 low income households targeted for 2007
- Aims to reduce particulate emissions from domestic burning of coal
- Methodology developed by DME

Emalahleni Water Treatment Plant

- Winner of the prestigious Mail and Guardian' Greening the future award'
- The division's Emalahleni Water Reclamation Plant (EWRP) was recognised for its innovative approach to turning waste into water, and received top honours in two categories: Companies with Innovative Environmental Strategies that Improve Business Performance and Water Care

Isibonelo Wetlands Project

- Isibonelo colliery recently lived up to its name (which means 'an example to others') when the colliery's wetland rehabilitation project won the environmental category in the Nedbank Capital Green Mining Awards competition

Additional Initiatives

- Key Customer seminars on SD
- CCS Atlas in RSA
- Coal Industry Roadmap in RSA

To conclude – Can coal be clean ?

- ▶ The world needs coal as a secure, abundant and cheap energy source
- ▶ To meet the climate change challenge the environmental footprint of coal will have to be improved
- ▶ The costs of doing so will not be cheap
- ▶ Technological development is vital but without supporting policies and financial assistance for R&D, success will be elusive

"We at the IEA love coal. It's cheap and widely available, but we have to have carbon capture and sequestration."

(Claude Mandil, executive director of the IEA)
